

# **CS 760: Machine Learning Neural Networks Continued**

Ilias Diakonikolas

University of Wisconsin-Madison

**Oct. 11, 2022**

# Logistics

- **Announcements:**

- HW 3 due Sunday.

- **Class roadmap:**

Tuesday, Oct. 11	Neural Networks II
Thursday, Oct. 13	Neural Networks III
Tuesday, Oct. 18	Neural Networks IV
Thursday, Oct. 20	Neural Networks V
Tuesday, Oct. 25	Practical Aspects of Training + Review

# Outline

- **Neural Networks**

- Introduction, Setup, Components, Activations

- **Training Neural Networks**

- SGD, Computing Gradients, Backpropagation

- **Regularization**

- Views, Data Augmentation, Other approaches

# Multilayer Neural Network

- Input: two features from spectral analysis of a spoken sound
- Output: vowel sound occurring in the context “h\_\_d”

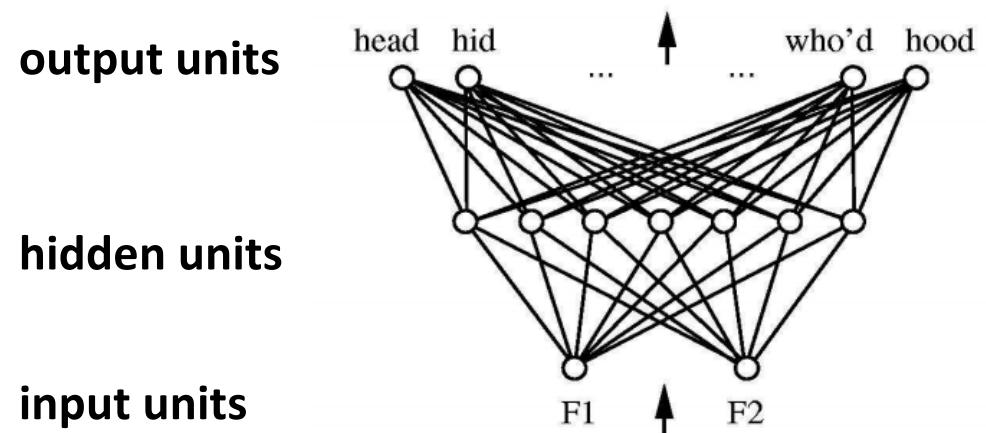

figure from Huang & Lippmann, NIPS 1988

# Neural Network Decision Regions

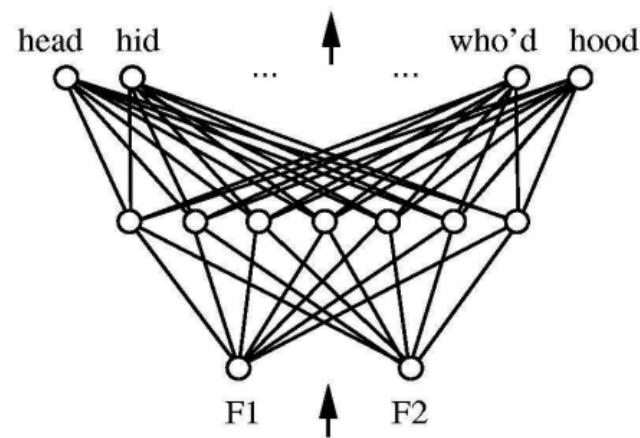

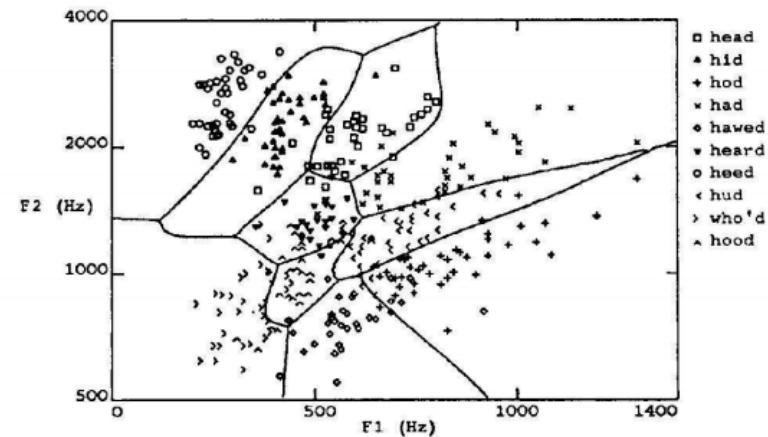

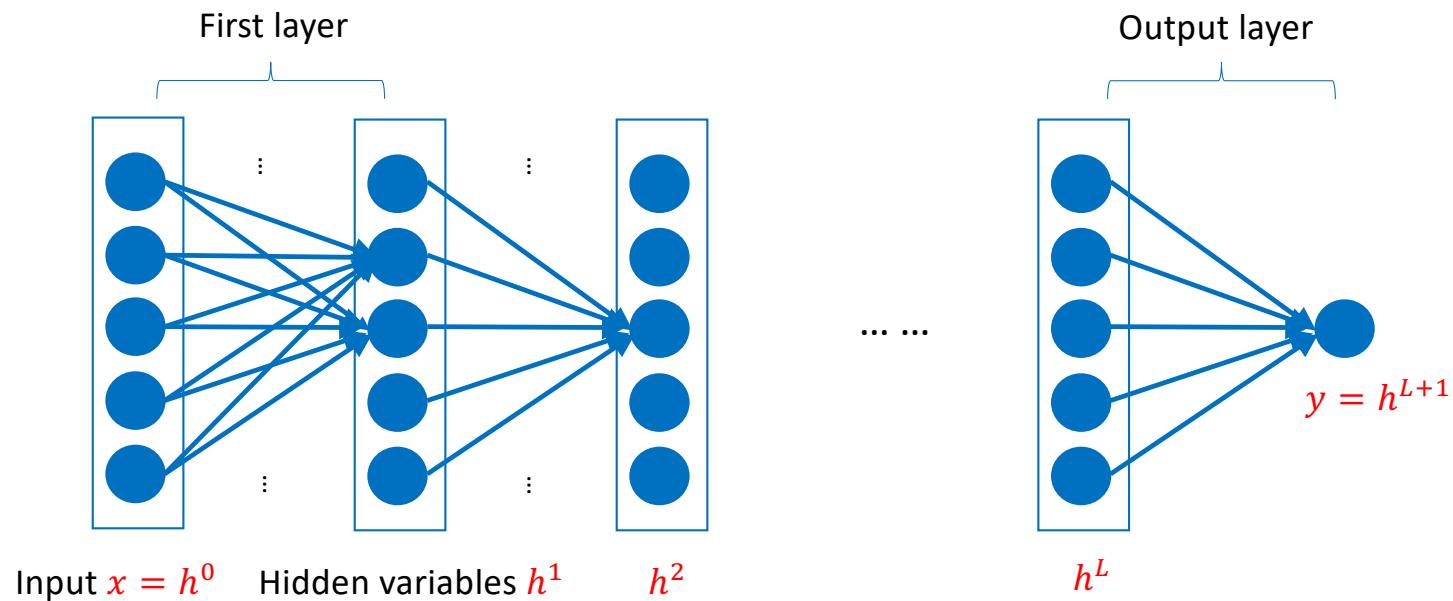

Figure from Huang & Lippmann, NIPS 1988

# Neural Network Components

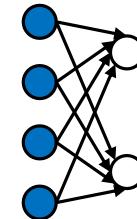

An  $(L + 1)$ -layer network

# Feature Encoding for NNs

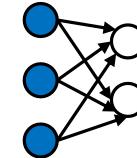

- Nominal features usually a one hot encoding

$$A = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} \quad C = \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} \quad G = \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \end{bmatrix} \quad T = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}$$

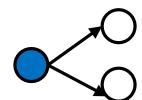

- Ordinal features: use a *thermometer* encoding

$$\text{small} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \quad \text{medium} = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} \quad \text{large} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

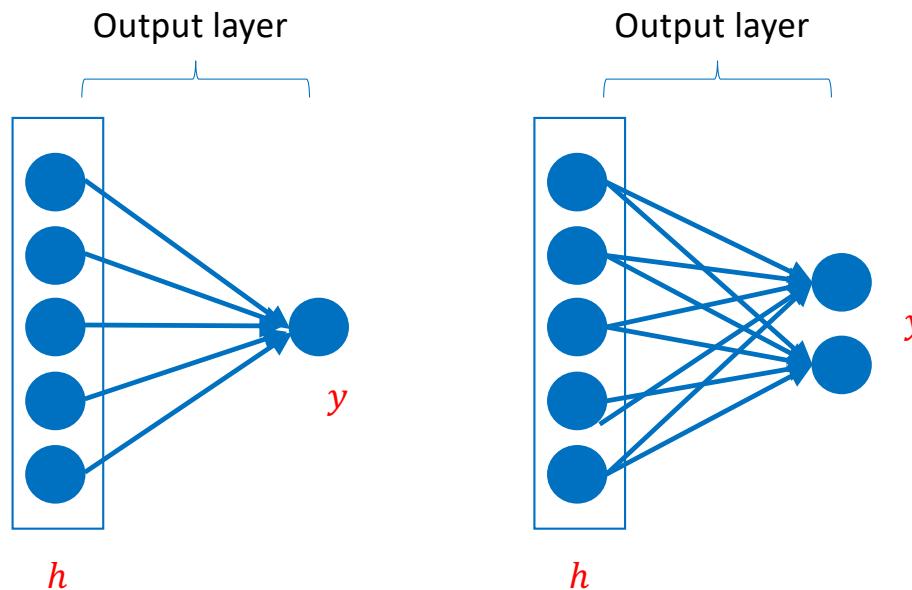

- Real-valued features use individual input units (may want to scale/normalize them first though)

$$\text{precipitation} = [0.68]$$

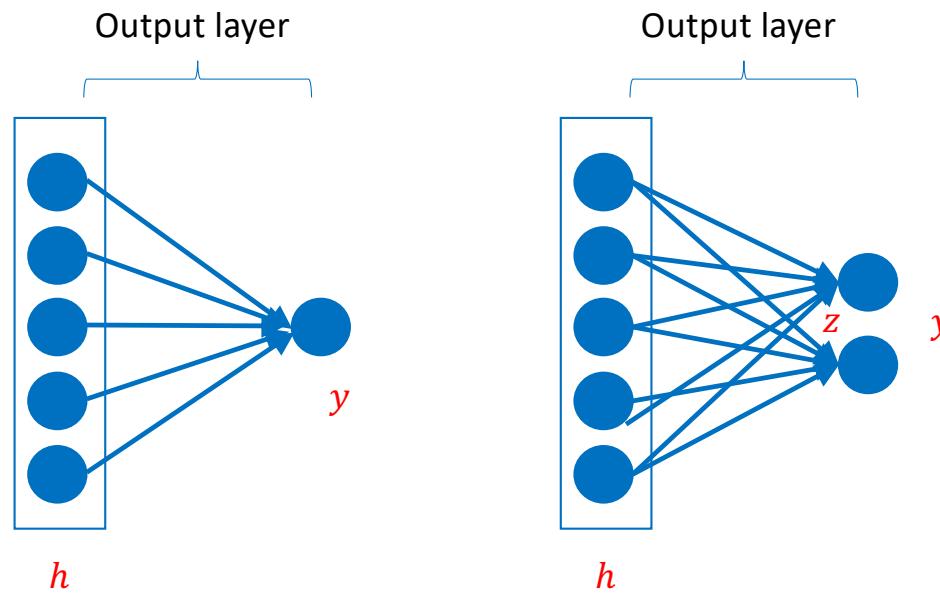

# Output Layer: Examples

- Regression:  $y = w^T h + b$ 
  - Linear units: no nonlinearity
- Multi-dimensional regression:  $y = W^T h + b$ 
  - Linear units: no nonlinearity

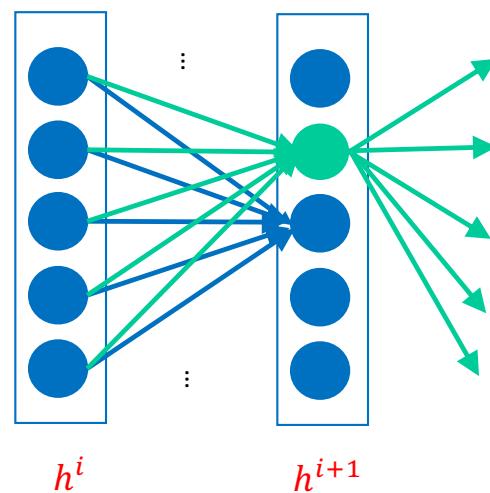

# Output Layer: Examples

- Binary classification:  $y = \sigma(w^T h + b)$ 
  - Corresponds to using logistic regression on  $h$
- Multiclass classification:
  - $y = \text{softmax}(z)$  where  $z = W^T h + b$

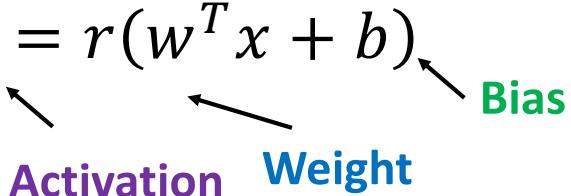

# Hidden Layers

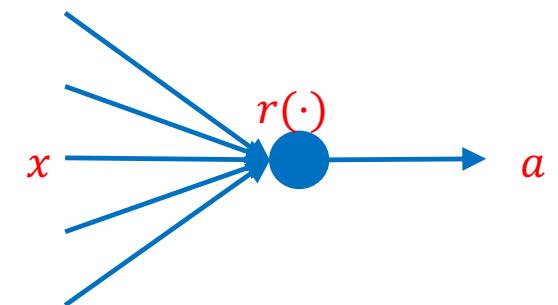

- Neuron takes weighted linear combination of the previous representation layer
  - Outputs one value for the next layer

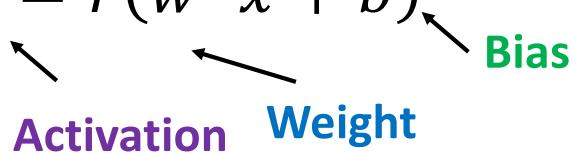

# Hidden Layers

- Outputs  $a = r(w^T x + b)$   

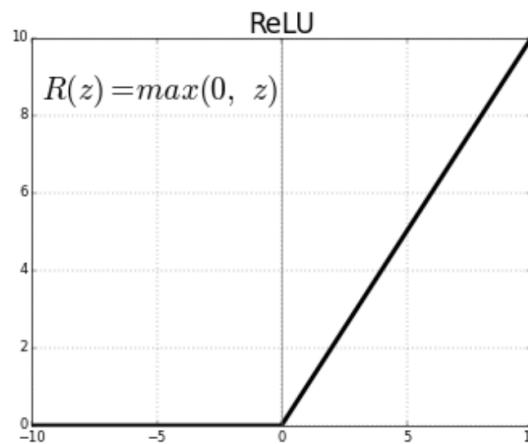

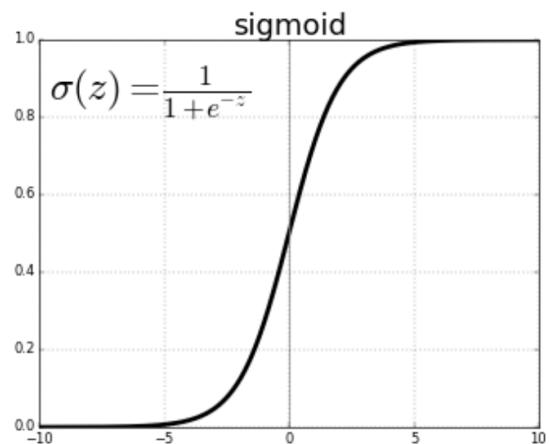

- Typical activation function  $r$ 
  - Sigmoid  $\sigma(z) = 1/(1 + \exp(-z))$
  - Tanh  $\tanh(z) = 2\sigma(2z) - 1$
  - ReLU  $r(z) = \max[0, z]$
- Why not **linear activation** functions?
  - Model would be linear.

# More on Activations

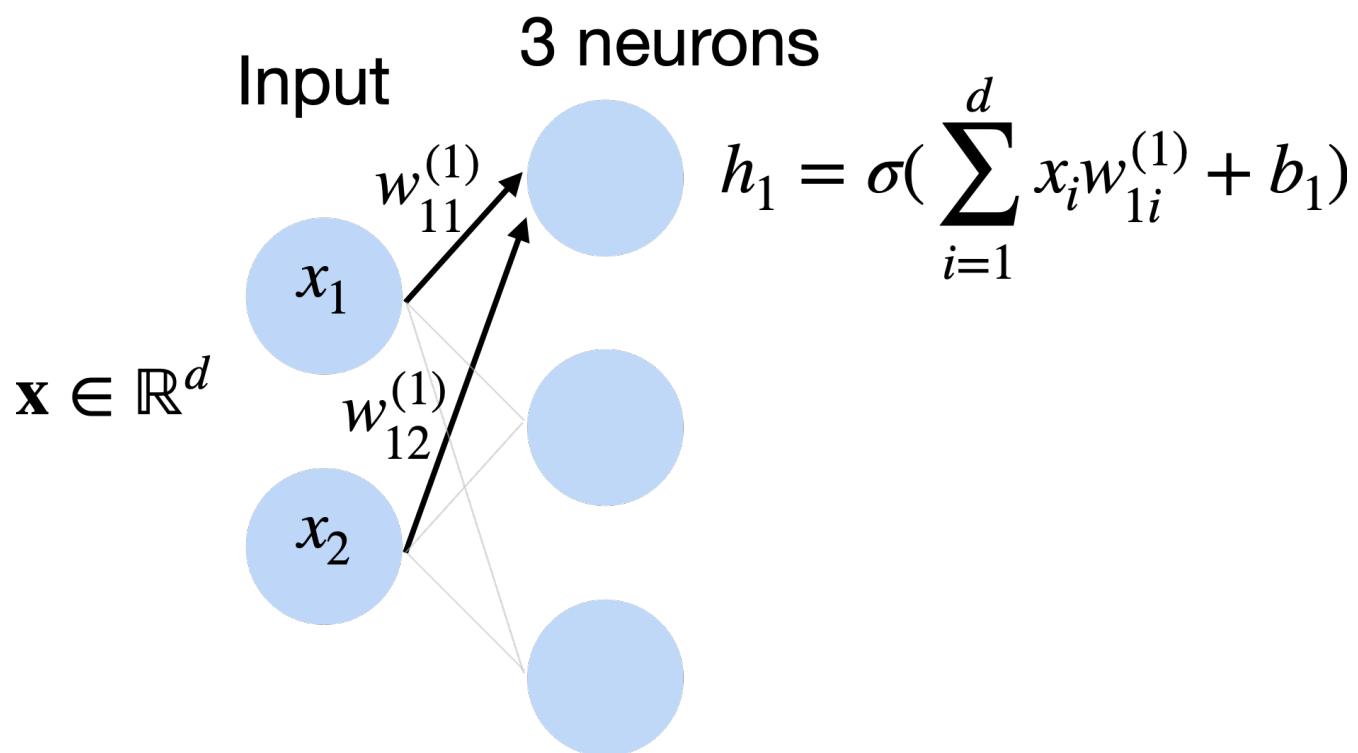

- Outputs  $a = r(w^T x + b)$   

Activation      Weight      Bias
- Consider **gradients**... saturating vs. nonsaturating

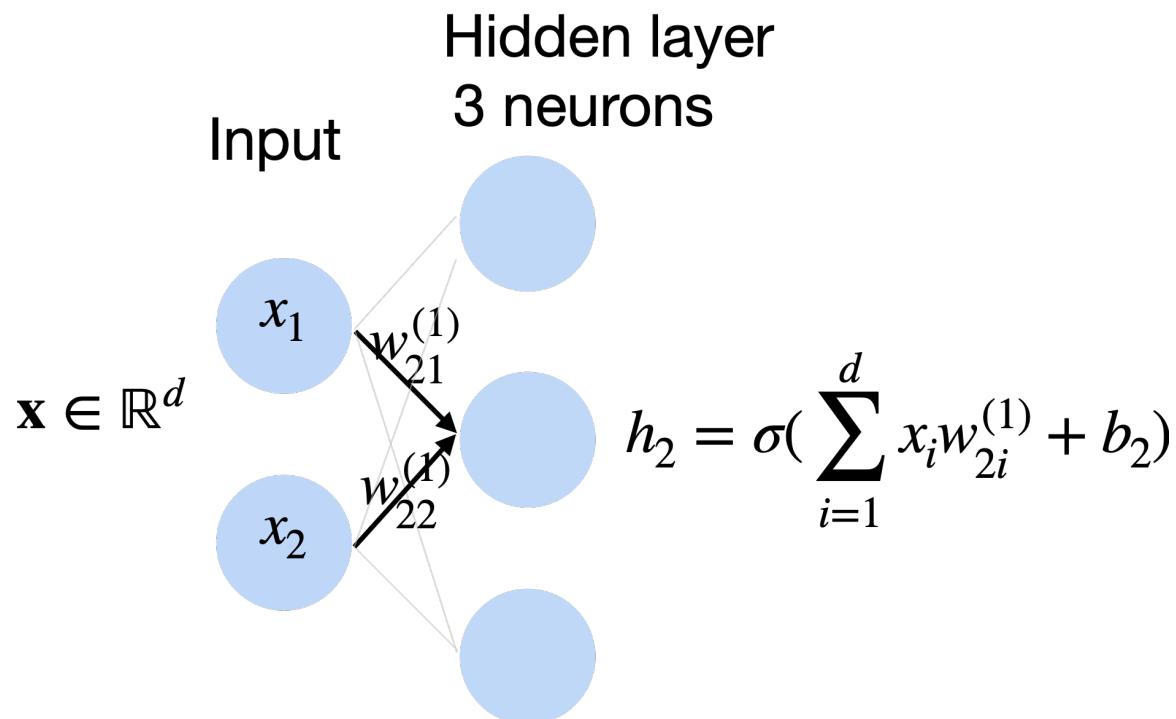

# MLPs: Multilayer Perceptron

- Ex: 1 hidden layer, 1 output layer: depth 2

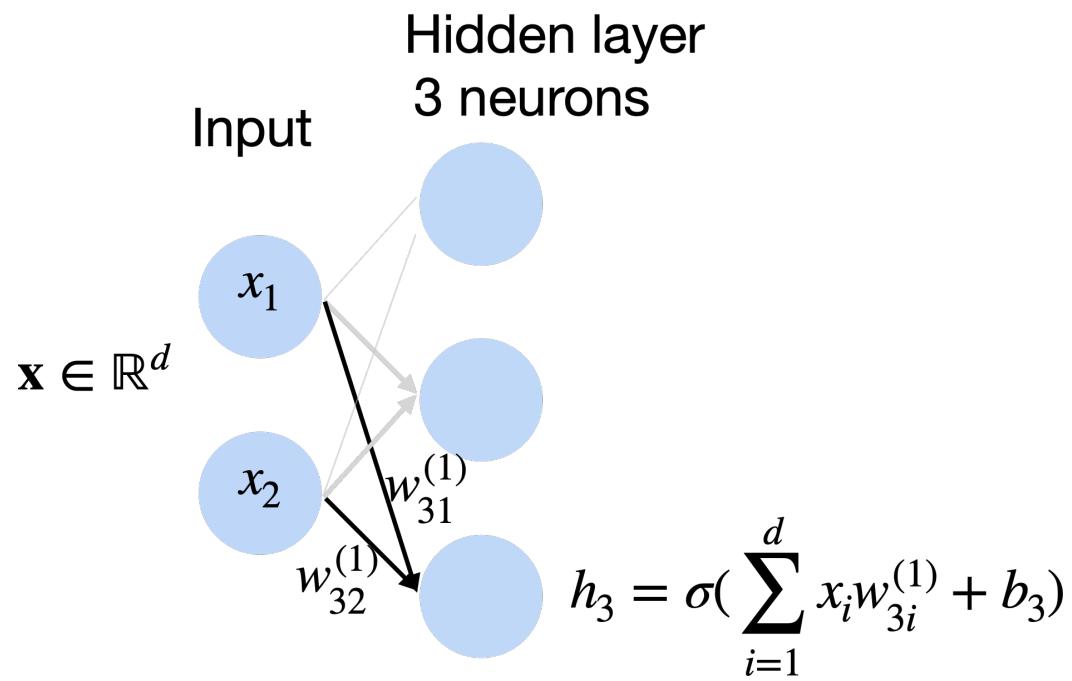

# MLPs: Multilayer Perceptron

- Ex: 1 hidden layer, 1 output layer: depth 2

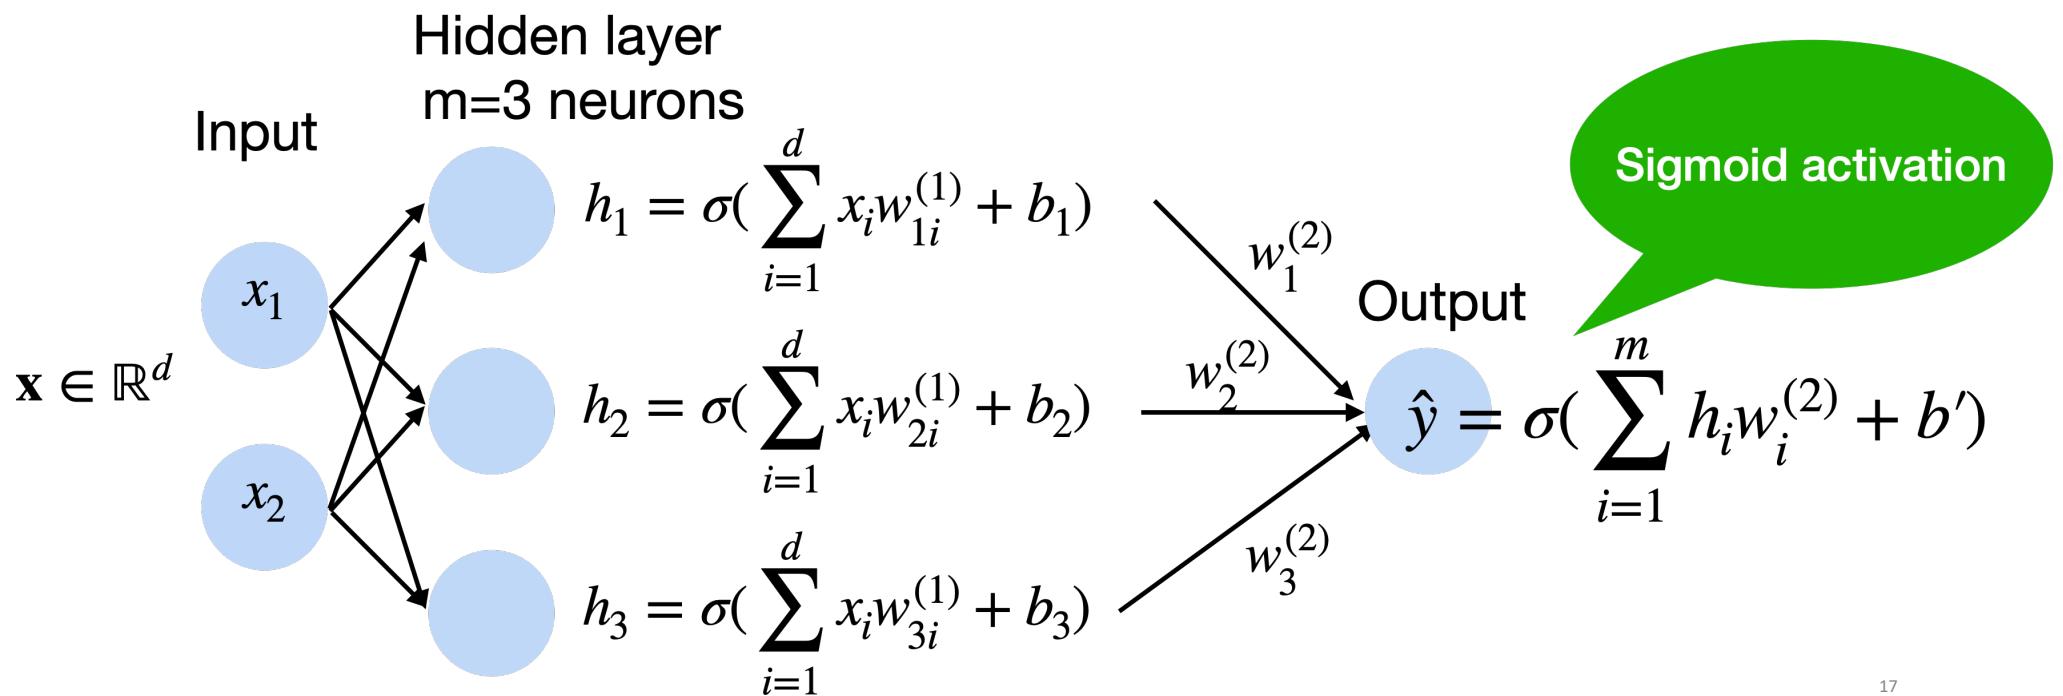

# MLPs: Multilayer Perceptron

- Ex: 1 hidden layer, 1 output layer: depth 2

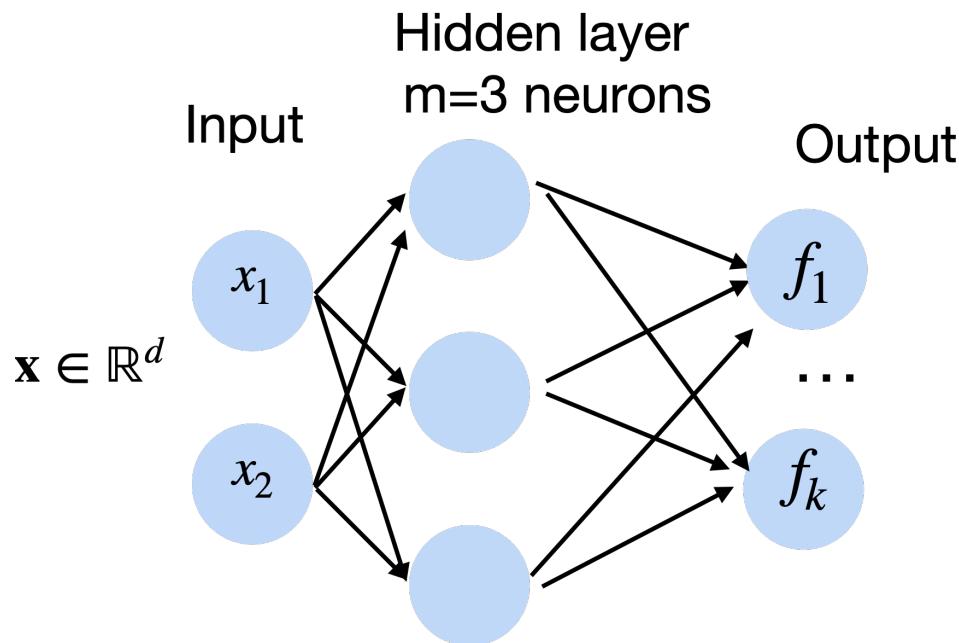

# MLPs: Multilayer Perceptron

- Ex: 1 hidden layer, 1 output layer: depth 2

# Multiclass Classification Output

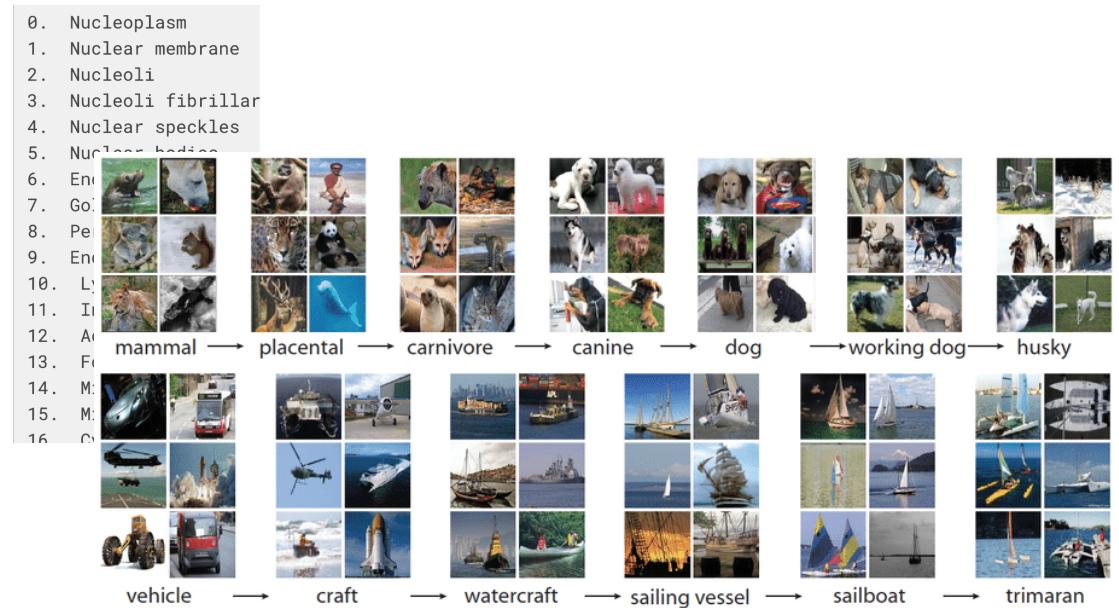

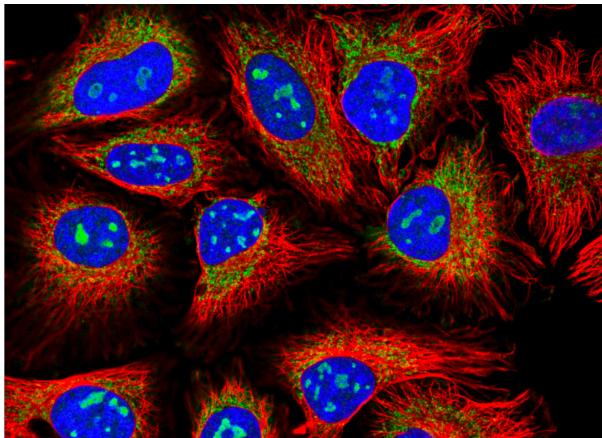

- Create  $k$  output units
- Use softmax (just like logistic regression)

$$\begin{aligned} p(y | \mathbf{x}) &= \text{softmax}(f) \\ &= \frac{\exp f_y(x)}{\sum_i^k \exp f_i(x)} \end{aligned}$$

# Multiclass Classification Examples

- Protein classification (Kaggle challenge)
- ImageNet

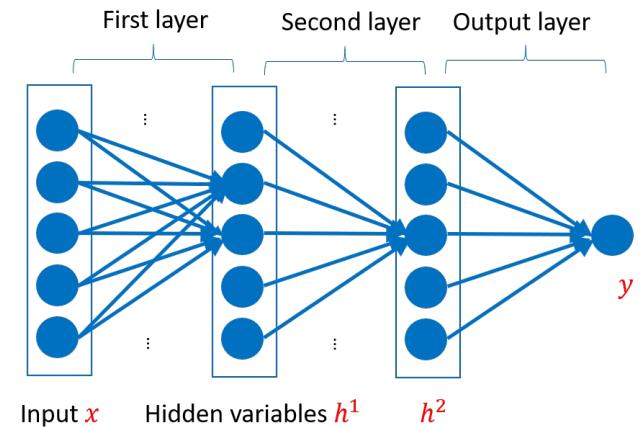

## Break & Quiz

## Q2-1: Select the correct option.

- A. *The more hidden-layer units a Neural Network has, the better it can predict desired outputs for new inputs that it was not trained with.*
  - B. *A 3-layers Neural Network with 5 neurons in the input and hidden representations and 1 neuron in the output has a total of 55 connections.*
- 
- 1. Both statements are true.
  - 2. Both statements are false.
  - 3. Statement A is true, Statement B is false.
  - 4. Statement B is true, Statement A is false.

  - 4. Statement B is true, Statement A is false.

# Outline

- **Neural Networks**

- Introduction, Setup, Components, Activations

- **Training Neural Networks**

- SGD, Computing Gradients, Backpropagation

- **Regularization**

- Views, Data Augmentation, Other approaches

# Training Neural Networks

- Training the usual way. Pick a loss and optimize
- **Example:** 2 scalar weights

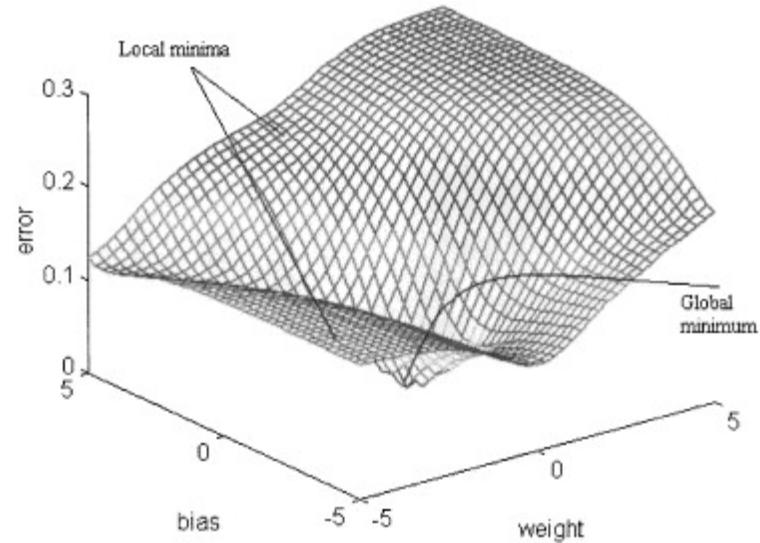

figure from Cho & Chow, *Neurocomputing* 1999

# Training Neural Networks: SGD

- Algorithm:
  - Get  $D = \{(x^{(1)}, y^{(1)}), \dots, (x^{(n)}, y^{(n)})\}$
  - Initialize weights
  - Until stopping criteria met,
    - Sample training point.  $(x^{(i)}, y^{(i)})$  without replacement
    - Compute:  $f_{\text{network}}(x^{(i)})$  ← **Forward Pass**
    - Compute gradient:  $\nabla L^{(i)}(w) = \left[ \frac{\partial L^{(d)}}{\partial w_0}, \frac{\partial L^{(d)}}{\partial w_1}, \dots, \frac{\partial L^{(d)}}{\partial w_m} \right]^T$  ← **Backward Pass**
    - Update weights:  $w \leftarrow w - \alpha \nabla L^{(i)}(w)$

# Training Neural Networks: Minibatch SGD

- Algorithm:
    - Get  $D = \{(x^{(1)}, y^{(1)}), \dots, (x^{(n)}, y^{(n)})\}$
    - Initialize weights
    - Until stopping criteria met,
      - Sample  $b$  points  $j_1, j_2, \dots, j_b$
      - Compute:  $f_{\text{network}}(x^{(j_1)}), \dots, f_{\text{network}}(x^{(j_b)})$  ← Forward Pass
      - Compute gradients:  $\nabla L^{(j_1)}(w), \dots, \nabla L^{(j_b)}(w)$  ← Backward Pass
      - Update weights:
- $$w \leftarrow w - \frac{\alpha}{b} \sum_{k=1}^b \nabla L^{(j_k)}(w)$$

# Training Neural Networks: Chain Rule

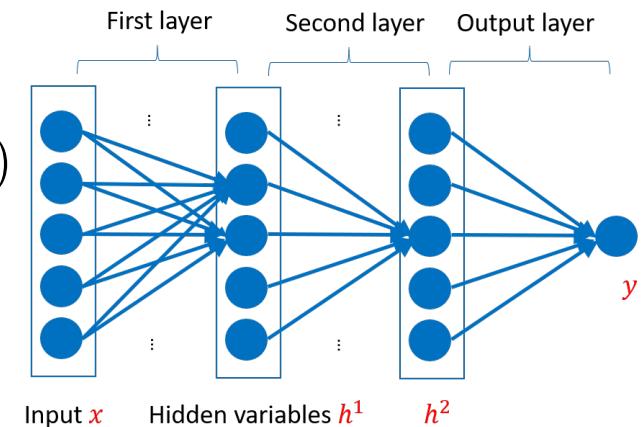

- Will need to compute terms like:  $\frac{\partial L}{\partial w_1}$
- But,  $L$  is a composition of:
  - Loss with output  $y$
  - Output itself a composition of softmax with outer layer
  - Outer layer a combination of outputs from previous layer
  - Outputs from prev. layer a composition of activations and linear functions...

- Need the **chain rule**!

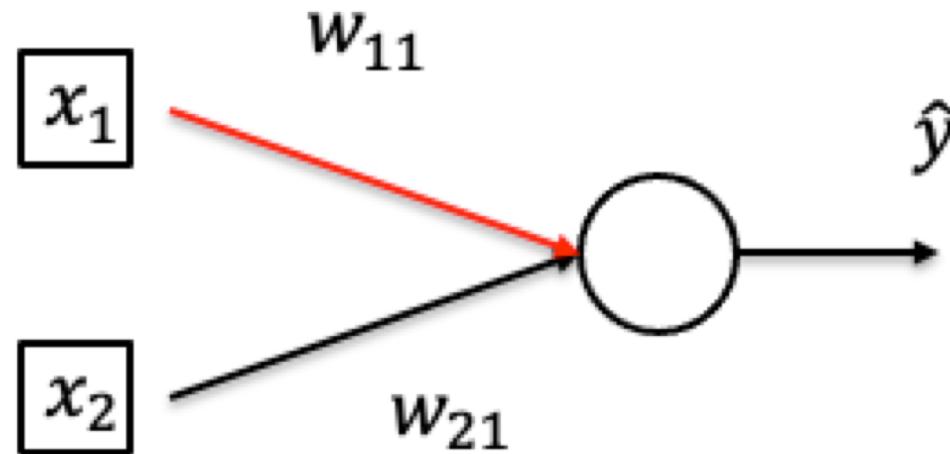

- Suppose  $L = L(g_1, \dots, g_k)$   $g_j = g_j(w_1, \dots, w_p)$

- Then,

$$\frac{\partial L}{\partial w_i} = \sum_{j=1}^k \frac{\partial L}{\partial g_j} \frac{\partial g_j}{\partial w_i}$$

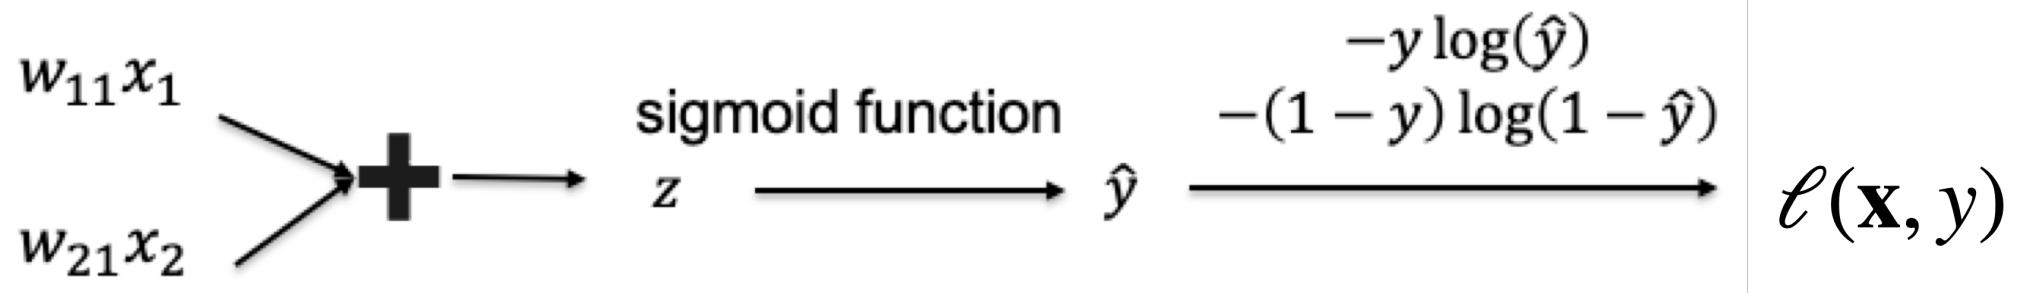

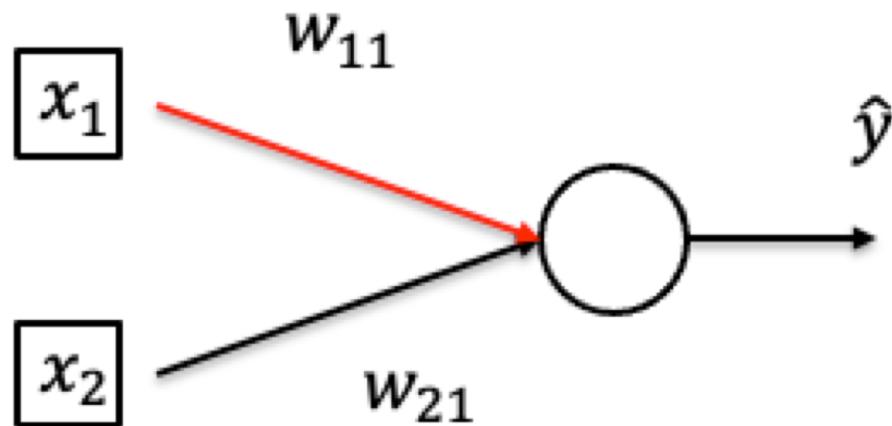

# Computing Gradients

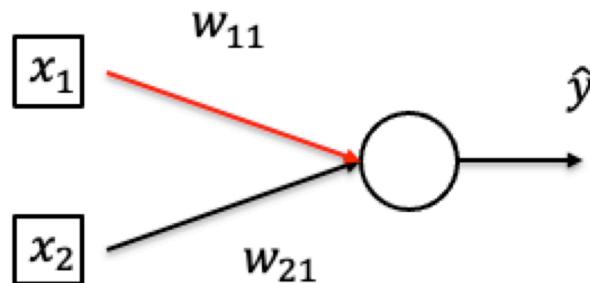

- Want to compute  $\frac{\partial \ell(\mathbf{x}, y)}{\partial w_{11}}$

# Computing Gradients

# Computing Gradients

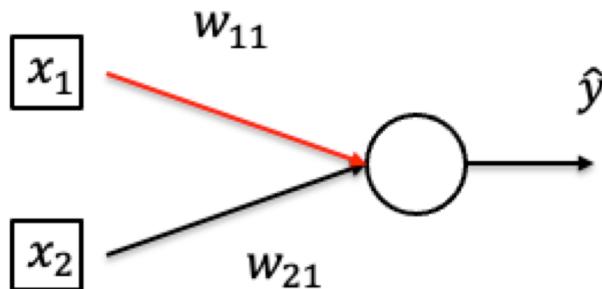

$w_{11}x_1$	$+ w_{21}x_2$	$\rightarrow z$	$\xrightarrow{\text{sigmoid function}}$	$\hat{y}$	$\xrightarrow{-y \log(\hat{y})}$	$\ell(\mathbf{x}, y)$
					$\xrightarrow{-(1 - y) \log(1 - \hat{y})}$	
				$\frac{\partial \hat{y}}{\partial z} = \sigma'(z)$	$\frac{\partial \ell(\mathbf{x}, y)}{\partial \hat{y}} = \frac{1 - y}{1 - \hat{y}} - \frac{y}{\hat{y}}$	

- By chain rule:

$$\frac{\partial l}{\partial w_{11}} = \frac{\partial l}{\partial \hat{y}} \frac{\partial \hat{y}}{\partial z} \frac{\partial z}{\partial w_{11}}$$

# Computing Gradients

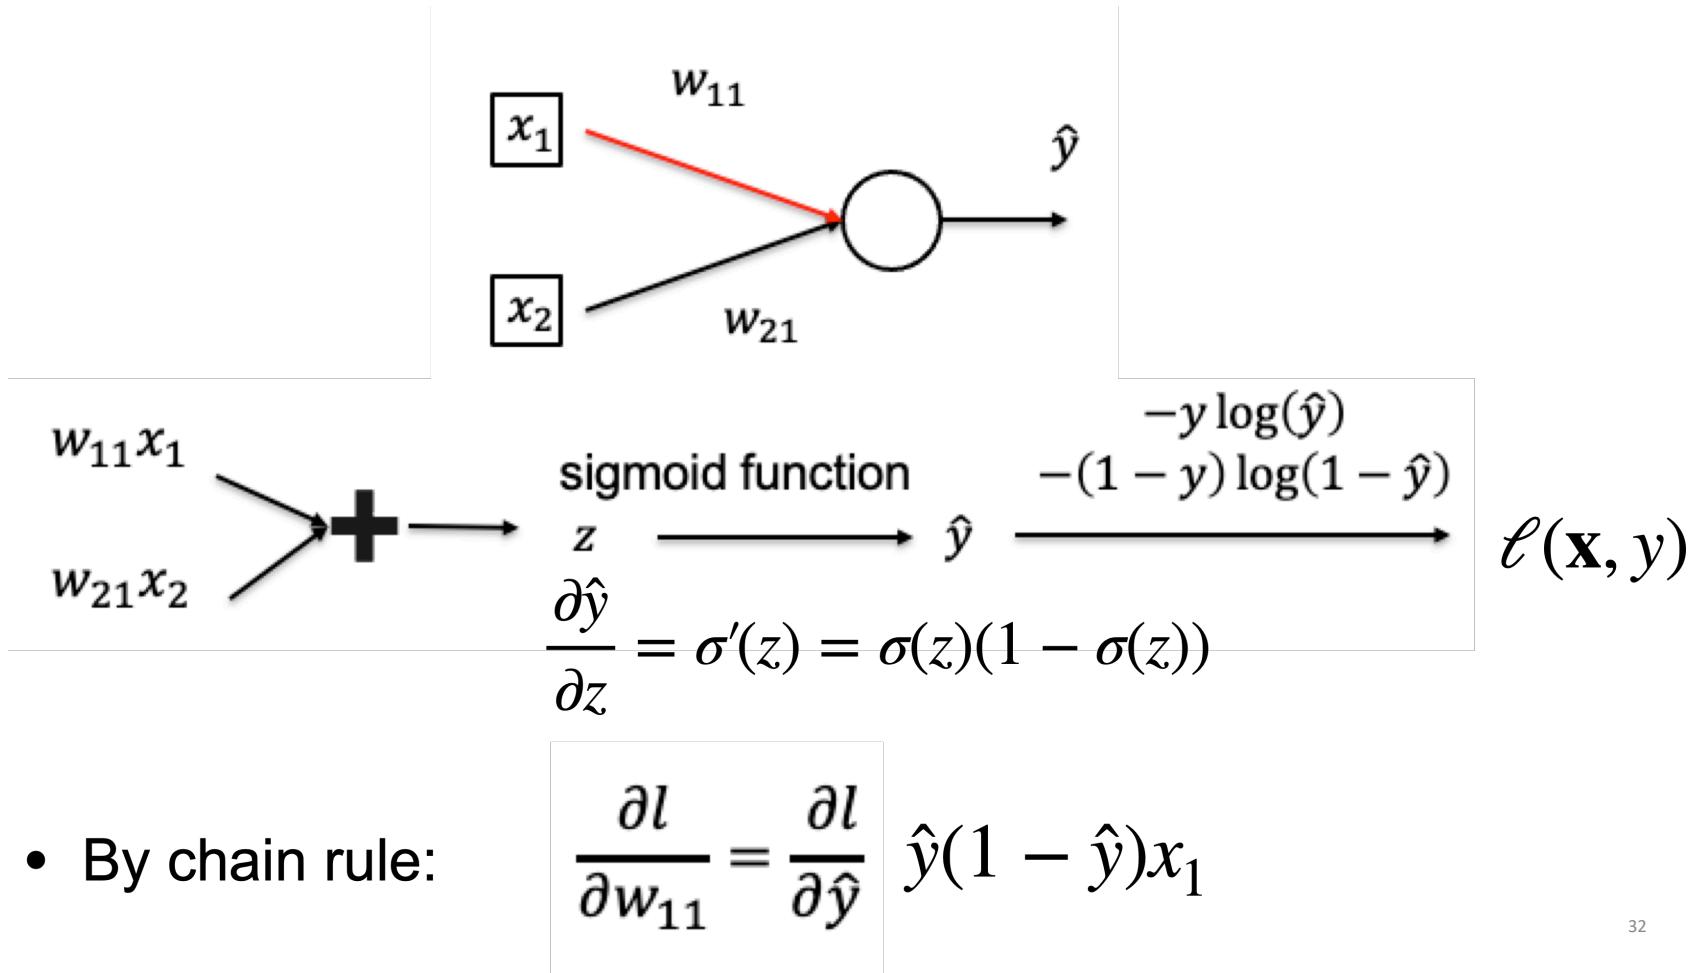

$$\begin{array}{ccccc} w_{11}x_1 & \xrightarrow{\quad\quad\quad} & z & \xrightarrow{\text{sigmoid function}} & \hat{y} \\ w_{21}x_2 & \xrightarrow{+} & & & \xrightarrow{-y \log(\hat{y})} \\ & & & & \xrightarrow{-(1-y) \log(1-\hat{y})} \\ & & & & \ell(\mathbf{x}, y) \\ \frac{\partial \hat{y}}{\partial z} = \sigma'(z) & & & & \frac{\partial \ell(\mathbf{x}, y)}{\partial \hat{y}} = \frac{1-y}{1-\hat{y}} - \frac{y}{\hat{y}} \end{array}$$

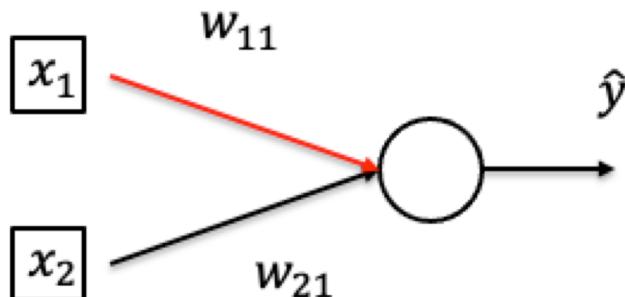

- By chain rule:

$$\frac{\partial l}{\partial w_{11}} = \frac{\partial l}{\partial \hat{y}} \frac{\partial \hat{y}}{\partial z} |_{x_1}$$

# Computing Gradients

# Computing Gradients

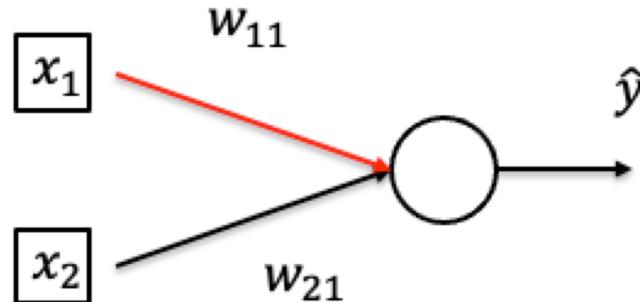

$$\begin{array}{c} w_{11}x_1 \\ w_{21}x_2 \end{array} \rightarrow \text{+} \rightarrow z \xrightarrow{\text{sigmoid function}} \hat{y} \xrightarrow{-y \log(\hat{y}) - (1 - \hat{y}) \log(1 - \hat{y})} \ell(\mathbf{x}, y)$$
$$\frac{\partial \hat{y}}{\partial z} = \sigma'(z) = \sigma(z)(1 - \sigma(z))$$

- By chain rule:

$$\frac{\partial l}{\partial w_{11}} = \left( \frac{1 - y}{1 - \hat{y}} - \frac{y}{\hat{y}} \right) \hat{y}(1 - \hat{y})x_1$$

# Computing Gradients

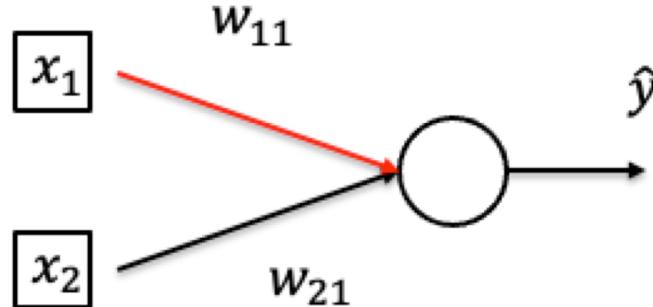

$$\begin{array}{c} w_{11}x_1 \\ w_{21}x_2 \end{array} \rightarrow \text{+} \rightarrow z \xrightarrow{\text{sigmoid function}} \hat{y} \xrightarrow{-y \log(\hat{y}) - (1 - \hat{y}) \log(1 - \hat{y})} \ell(\mathbf{x}, y)$$
$$\frac{\partial \hat{y}}{\partial z} = \sigma'(z) = \sigma(z)(1 - \sigma(z))$$

- By chain rule:

$$\frac{\partial l}{\partial w_{11}} = (\hat{y} - y)x_1$$

# Computing Gradients

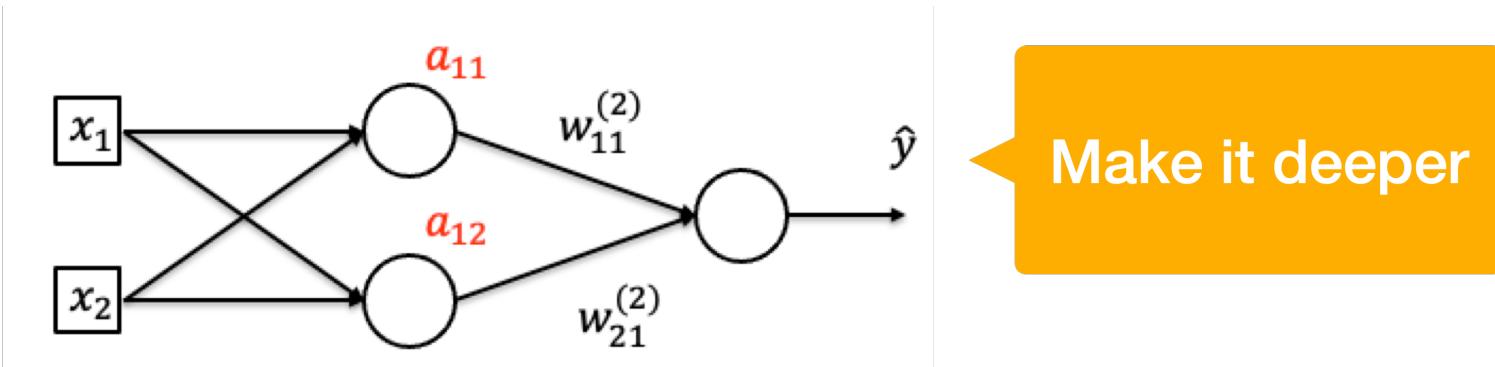

$$\begin{array}{c} w_{11}x_1 \\ w_{21}x_2 \end{array} \rightarrow \text{+} \rightarrow z \xrightarrow{\text{sigmoid function}} \hat{y} \xrightarrow{-y \log(\hat{y}) - (1 - \hat{y}) \log(1 - \hat{y})} \ell(\mathbf{x}, y)$$
$$\frac{\partial \hat{y}}{\partial z} = \sigma'(z) = \sigma(z)(1 - \sigma(z))$$

- By chain rule:

$$\frac{\partial l}{\partial x_1} = \frac{\partial l}{\partial \hat{y}} \frac{\partial \hat{y}}{\partial z} w_{11} = (\hat{y} - y)w_{11}$$

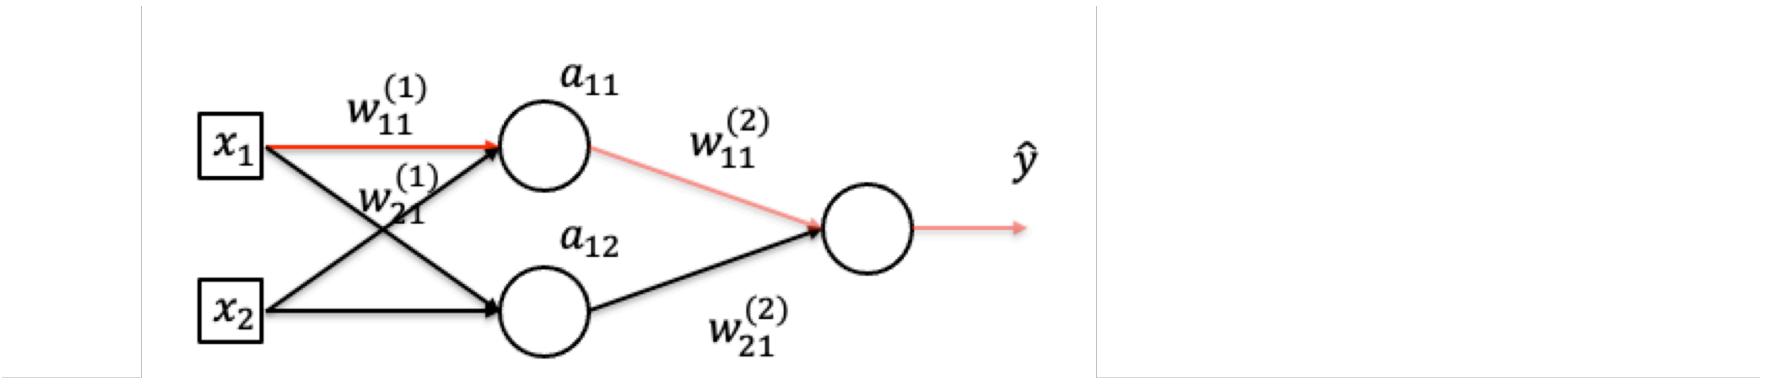

# Computing Gradients: More Layers

$$\begin{array}{c} w_{11}^{(2)} \color{red}{a_{11}} \\ w_{21}^{(2)} \color{red}{a_{12}} \end{array} \rightarrow \text{+} \rightarrow \begin{array}{c} \text{sigmoid function} \\ z \longrightarrow \hat{y} \end{array} \quad \frac{\partial \hat{y}}{\partial z} = \sigma'(z) = \sigma(z)(1 - \sigma(z)) \quad \frac{-y \log(\hat{y})}{-(1 - y) \log(1 - \hat{y})} \longrightarrow \ell(\mathbf{x}, y)$$

- By chain rule:  $\frac{\partial l}{\partial a_{11}} = (\hat{y} - y)w_{11}^{(2)}, \frac{\partial l}{\partial a_{12}} = (\hat{y} - y)w_{21}^{(2)}$

# Computing Gradients: More Layers

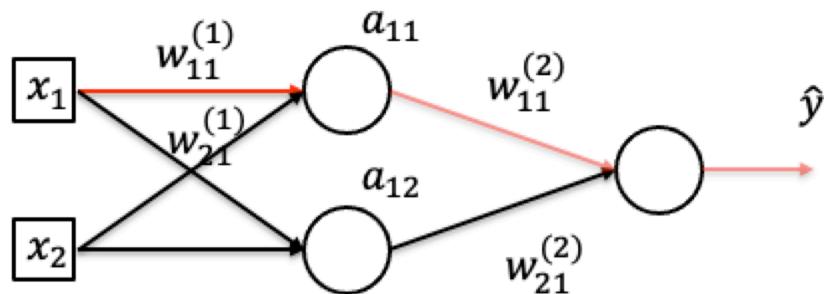

$$\begin{aligned} w_{11}^{(1)}x_1 & \quad \quad \quad + \quad \quad \quad z_{11} \xrightarrow{\sigma(z_{11})} a_{11} \xrightarrow{} l(x, y) \\ w_{21}^{(1)}x_2 & \end{aligned}$$
$$\frac{\partial a_{11}}{\partial z_{11}} = \sigma'(z_{11}) \quad \frac{\partial l}{\partial a_{11}} = (\hat{y} - y)w_{11}^{(2)}$$

- By chain rule:

$$\frac{\partial l}{\partial w_{11}} = \frac{\partial l}{\partial a_{11}} \frac{\partial a_{11}}{\partial w_{11}^{(1)}} = (\hat{y} - y)w_{11}^{(2)} \frac{\partial a_{11}}{\partial w_{11}^{(1)}}$$

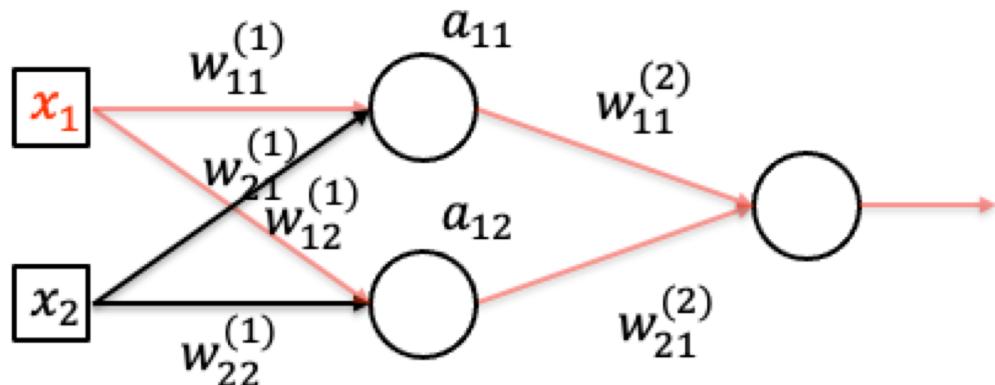

# Computing Gradients: More Layers

$$\begin{aligned}
 & w_{11}^{(1)}x_1 + w_{21}^{(1)}x_2 \rightarrow z_{11} \xrightarrow{\sigma(z_{11})} a_{11} \xrightarrow{\frac{\partial l}{\partial a_{11}} = \sigma'(z_{11})} \frac{\partial l}{\partial a_{11}} = (\hat{y} - y)w_{11}^{(2)} \\
 & l(x, y)
 \end{aligned}$$

- By chain rule:  $\frac{\partial l}{\partial w_{11}} = \frac{\partial l}{\partial a_{11}} \frac{\partial a_{11}}{\partial w_{11}^{(1)}} = (\hat{y} - y)w_{11}^{(2)}a_{11}(1 - a_{11})x_1$

# Computing Gradients: More Layers

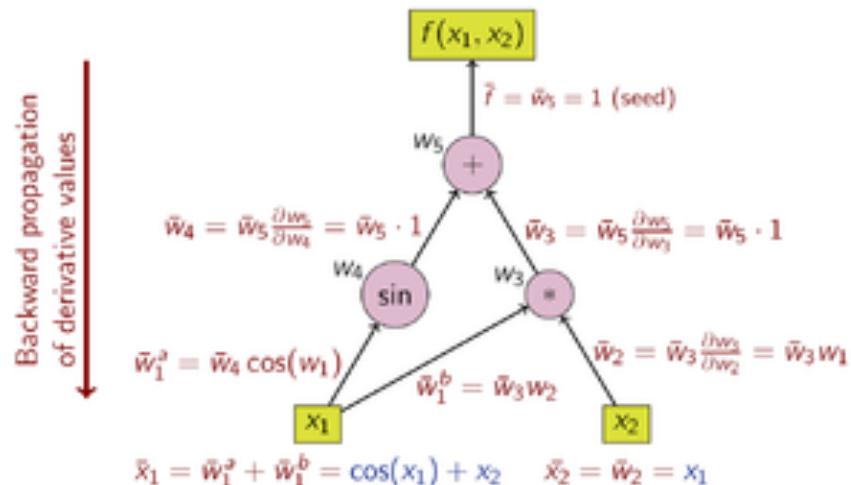

$$\begin{aligned}
 & w_{11}^{(1)}x_1 + w_{21}^{(1)}x_2 \rightarrow z_{11} \xrightarrow{\sigma(z_{11})} a_{11} \xrightarrow{} l(x, y) \\
 & \frac{\partial a_{11}}{\partial z_{11}} = \sigma'(z_{11}) \quad \frac{\partial l}{\partial a_{11}} = (\hat{y} - y)w_{11}^{(2)}
 \end{aligned}$$

- By chain rule:

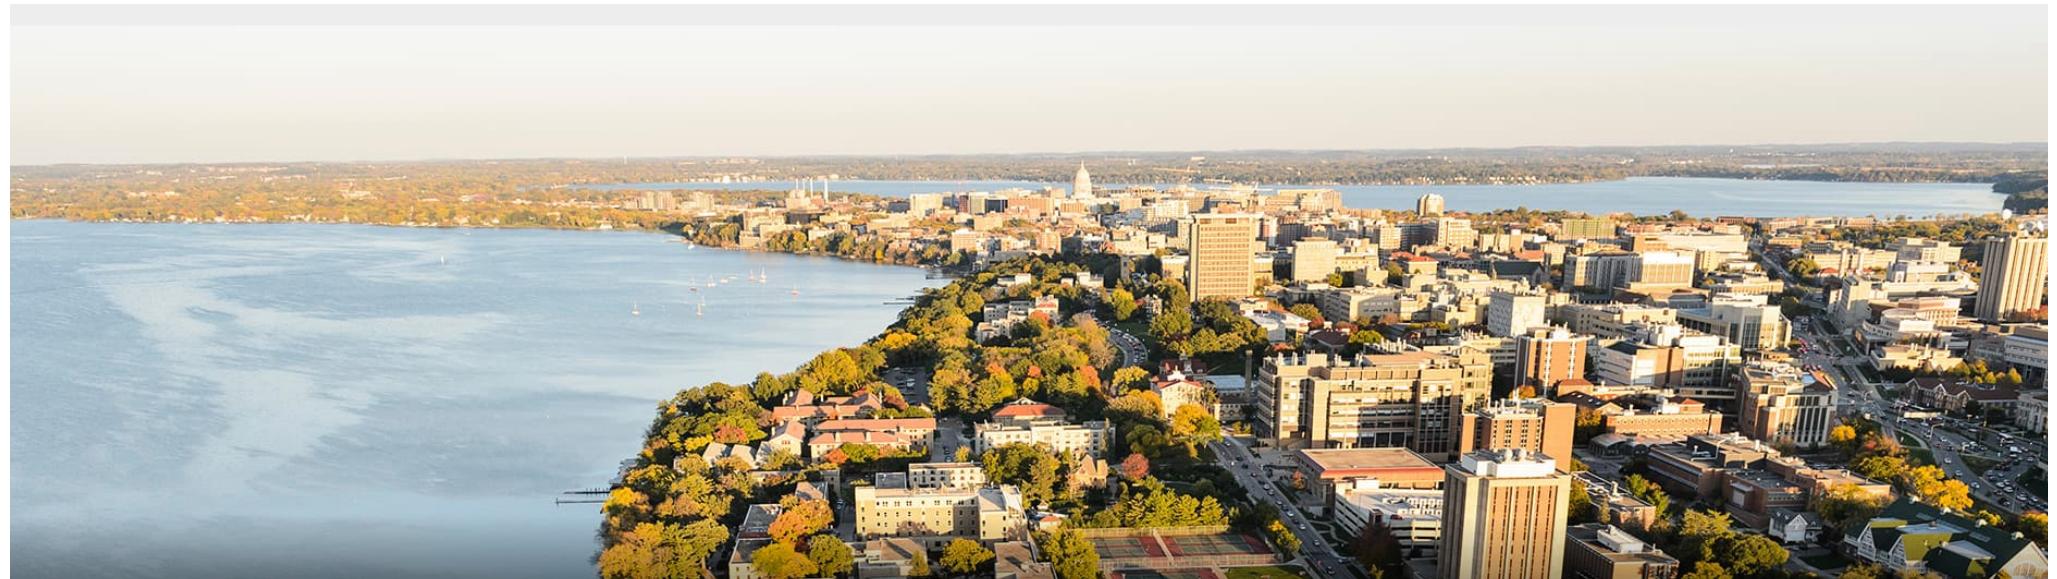

$$\frac{\partial l}{\partial x_1} = \frac{\partial l}{\partial a_{11}} \frac{\partial a_{11}}{\partial x_1} + \frac{\partial l}{\partial a_{12}} \frac{\partial a_{12}}{\partial x_1}$$

# Backpropagation

- Now we can compute derivatives for particular neurons, but we want to automate this process
- Set up a computation graph and run on the graph
- Go backwards from top to bottom, recursively computing gradients

Wiki

## Break & Quiz

Q2-1: Are these statements true or false?

- (A) Backpropagation is based on the chain rule.
- (B) Backpropagation contains only forward passes.

- 1. True, True
- 2. True, False
- 3. False, True
- 4. False, False

Q2-1: Are these statements true or false?

- (A) Backpropagation is based on the chain rule.
- (B) Backpropagation contains only forward passes.

- 1. True, True
- 2. True, False
- 3. False, True
- 4. False, False

- (A) We use chain rule to calculate the partial derivatives of composite functions like neural network.
- (B) It contains both forward and backward passes.

# Outline

- **Neural Networks**

- Introduction, Setup, Components, Activations

- **Training Neural Networks**

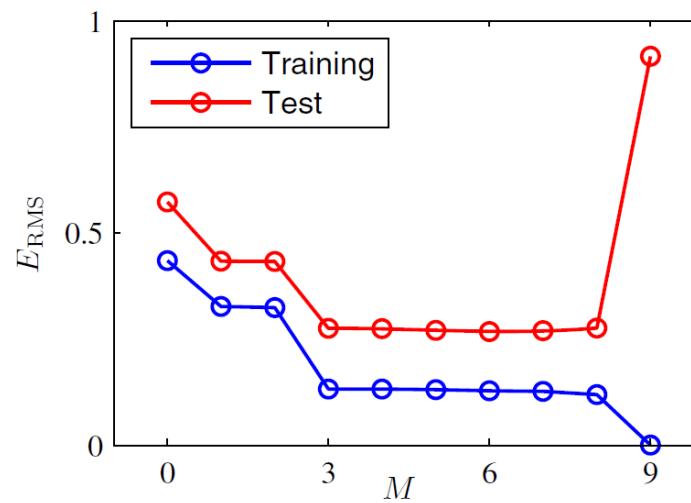

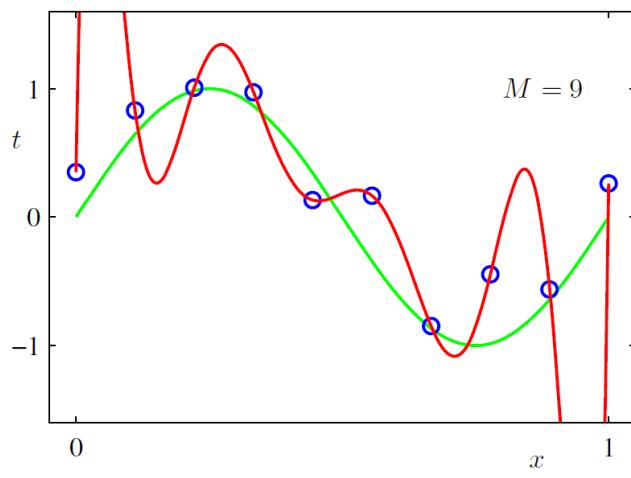

- SGD, Computing Gradients, Backpropagation

- **Regularization**

- Views, Data Augmentation, Other approaches

# Review: Overfitting

- What is it? When empirical loss and expected loss are different
- Possible solutions:
  - Larger data set
  - Throwing away useless hypotheses also helps (**regularization**)

# Review: Regularization

- In general: any method to **prevent overfitting** or **help optimization**
- One approach: additional terms in the optimization objective
- Different “views”
  - Hard constraint,
  - Soft constraint,
  - Bayesian view

# Regularization: Hard Constraint View

- Training objective / parametrized version

$$\min_f \hat{L}(f) = \frac{1}{n} \sum_{i=1}^n l(f, x_i, y_i)$$

subject to:  $f \in \mathcal{H}$

$$\min_\theta \hat{L}(\theta) = \frac{1}{n} \sum_{i=1}^n l(\theta, x_i, y_i)$$

subject to:  $\theta \in \Omega$

- When  $\Omega$  measured by some quantity  $R$

$$\min_\theta \hat{L}(\theta) = \frac{1}{n} \sum_{i=1}^n l(\theta, x_i, y_i)$$

subject to:  $R(\theta) \leq r$

$$\min_\theta \hat{L}(\theta) = \frac{1}{n} \sum_{i=1}^n l(\theta, x_i, y_i)$$

subject to:  $\|\theta\|_2^2 \leq r^2$

L2 Regularization

# Regularization: Soft Constraint View

- Equivalent to, for some parameter  $\lambda^* > 0$

$$\min_{\theta} \hat{L}_R(\theta) = \frac{1}{n} \sum_{i=1}^n l(\theta, x_i, y_i) + \lambda^* R(\theta)$$

- For L2,

$$\min_{\theta} \hat{L}_R(\theta) = \frac{1}{n} \sum_{i=1}^n l(\theta, x_i, y_i) + \lambda^* \|\theta\|_2^2$$

- Comes from **Lagrangian duality**

# Regularization: Bayesian Prior View

- Recall our MAP version of training. Bayes law:

$$p(\theta \mid \{x_i, y_i\}) = \frac{p(\theta)p(\{x_i, y_i\} \mid \theta)}{p(\{x_i, y_i\})}$$

- MAP:

$$\max_{\theta} \log p(\theta \mid \{x_i, y_i\}) = \min_{\theta} \underbrace{-\log p(\theta)}_{\text{Regularization}} \underbrace{-\log p(\{x_i, y_i\} \mid \theta)}_{\text{MLE loss}}$$

- L2: Corresponds to normal  $p(x \mid y, \theta)$ , **normal prior**  $p(\theta)$

# Choice of View?

- Typical choice for optimization: soft-constraint

$$\min_{\theta} \hat{L}_R(\theta) = \hat{L}(\theta) + \lambda R(\theta)$$

- Hard constraint / Bayesian view: conceptual / for derivation
- Hard-constraint preferred if
  - Know the explicit bound  $R(\theta) \leq r$
- Bayesian view preferred if
  - Domain knowledge easy to represent as a prior

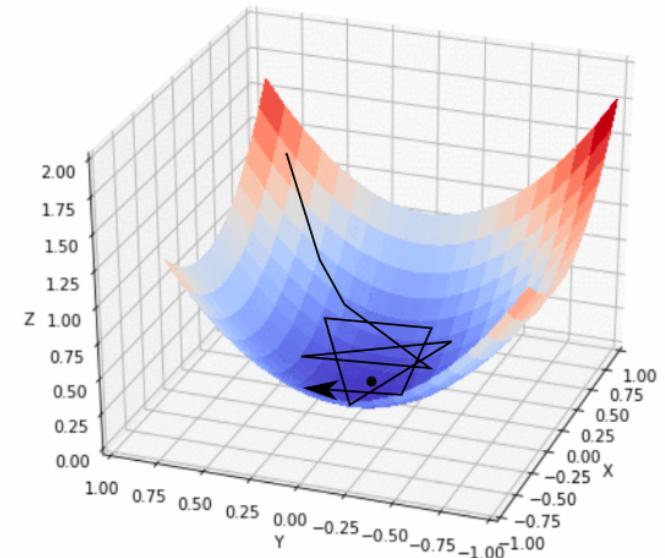

# Examples: L2 Regularization

- Again,

$$\min_{\theta} \hat{L}_R(\theta) = \hat{L}(\theta) + \frac{\lambda}{2} \|\theta\|_2^2$$

- Questions: what are the
  - Effects on (stochastic) gradient descent?
  - Effects on the optimal solution?

## L2 Regularization: Effect on GD

- Gradient of regularized objective

$$\nabla \hat{L}_R(\theta) = \nabla \hat{L}(\theta) + \lambda \theta$$

- Gradient descent update

$$\theta \leftarrow \theta - \eta \nabla \hat{L}_R(\theta) = \theta - \eta \nabla \hat{L}(\theta) - \eta \lambda \theta$$

$$= (1 - \eta \lambda) \theta - \eta \nabla \hat{L}(\theta)$$

- In words, **weight decay**

# L2 Regularization: Effect on Optimal Solution

- Consider a quadratic approximation around  $\theta^*$

$$\hat{L}(\theta) \approx \hat{L}(\theta^*) + (\theta - \theta^*)^T \nabla \hat{L}(\theta^*) + \frac{1}{2} (\theta - \theta^*)^T H(\theta - \theta^*)$$

- Since  $\theta^*$  is optimal,  $\nabla \hat{L}(\theta^*) = 0$

$$\hat{L}(\theta) \approx \hat{L}(\theta^*) + \frac{1}{2} (\theta - \theta^*)^T H(\theta - \theta^*)$$

$$\nabla \hat{L}(\theta) \approx H(\theta - \theta^*)$$

# L2 Regularization: Effect on Optimal Solution

- Gradient of regularized objective:  $\nabla \hat{L}_R(\theta) \approx H(\theta - \theta^*) + \lambda\theta$
- On the optimal  $\theta_R^*$ :  $0 = \nabla \hat{L}_R(\theta_R^*) \approx H(\theta_R^* - \theta^*) + \lambda\theta_R^*$ 
$$\theta_R^* \approx (H + \lambda I)^{-1} H \theta^*$$
- $H$  has eigendecomps.  $H = Q\Lambda Q^T$ , assume  $(\Lambda + \lambda I)^{-1}$  exists:
$$\theta_R^* \approx (H + \lambda I)^{-1} H \theta^* = Q(\Lambda + \lambda I)^{-1} \Lambda Q^T \theta^*$$
- Effect: **rescale along eigenvectors of  $H$**

# L2 Regularization: Effect on Optimal Solution

Effect: rescale along eigenvectors of  $H$

**Visual Example:**

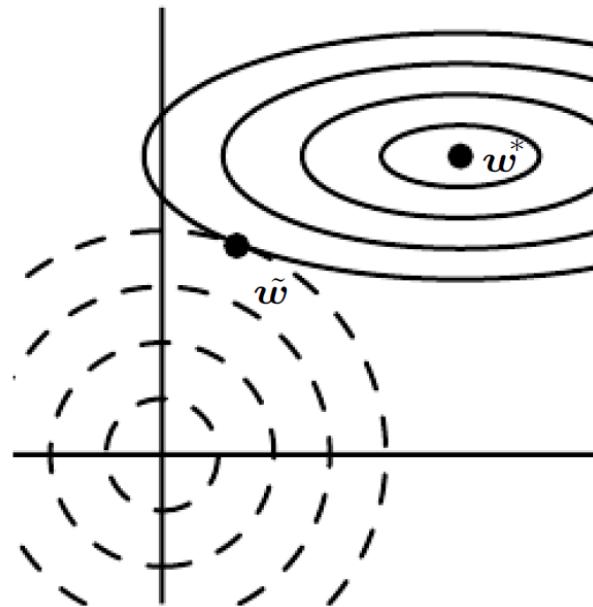

Figure from *Deep Learning*,  
Goodfellow, Bengio and Courville

# L1 Regularization: Effect on GD

$$\min_{\theta} \hat{L}_R(\theta) = \hat{L}(\theta) + \lambda ||\theta||_1$$

- Effect on (stochastic) gradient descent:
- Gradient of regularized objective

$$\nabla \hat{L}_R(\theta) = \nabla \hat{L}(\theta) + \lambda \text{sign}(\theta)$$

where **sign** applies to each element in  $\theta$

- Gradient descent update

$$\theta \leftarrow \theta - \eta \nabla \hat{L}_R(\theta) = \theta - \eta \nabla \hat{L}(\theta) - \eta \lambda \text{sign}(\theta)$$

# L1 Regularization: Effect on Optimal Solution

- Again,

$$\hat{L}(\theta) \approx \hat{L}(\theta^*) + \frac{1}{2} (\theta - \theta^*)^T H (\theta - \theta^*)$$

- Further assume that  $H$  is diagonal and positive ( $H_{ii} > 0, \forall i$ )
  - **not true in general** but assume for getting some intuition
- The regularized objective is (ignoring constants)

$$\hat{L}_R(\theta) \approx \sum_i \frac{1}{2} H_{ii} (\theta_i - \theta_i^*)^2 + \lambda |\theta_i|$$

# L1 Regularization: Effect on Optimal Solution

- The regularized objective is (ignoring constants)

$$\hat{L}_R(\theta) \approx \sum_i \frac{1}{2} H_{ii} (\theta_i - \theta_i^*)^2 + \lambda |\theta_i|$$

- The optimal  $\theta_R^*$

$$(\theta_R^*)_i \approx \begin{cases} \max\left\{\theta_i^* - \frac{\lambda}{H_{ii}}, 0\right\} & \text{if } \theta_i^* \geq 0 \\ \min\left\{\theta_i^* + \frac{\lambda}{H_{ii}}, 0\right\} & \text{if } \theta_i^* < 0 \end{cases}$$

- Compact expression for the optimal  $\theta_R^*$

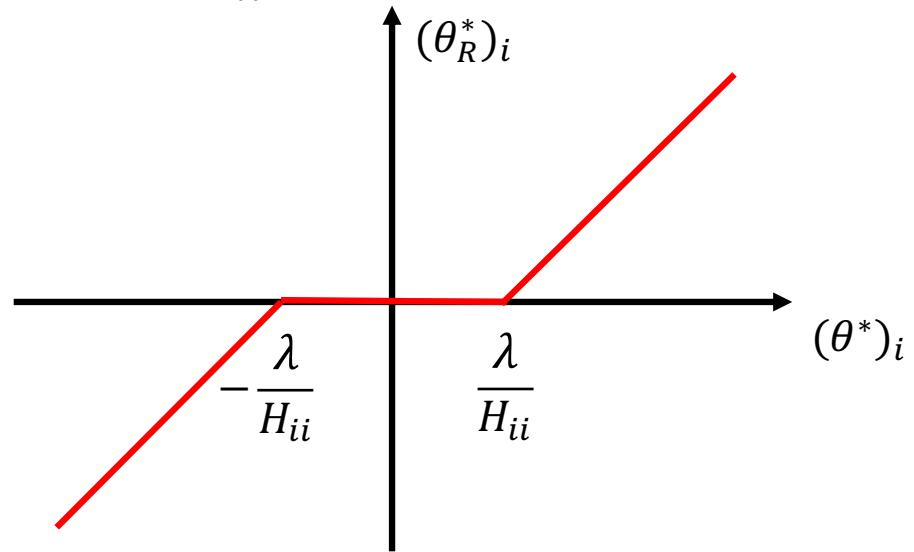

$$(\theta_R^*)_i \approx \text{sign}(\theta_i^*) \max\left\{|\theta_i^*| - \frac{\lambda}{H_{ii}}, 0\right\}$$

# L1 Regularization: Effect on Optimal Solution

- The optimal  $\theta_R^*$

$$(\theta_R^*)_i \approx \begin{cases} \max\left\{\theta_i^* - \frac{\lambda}{H_{ii}}, 0\right\} & \text{if } \theta_i^* \geq 0 \\ \min\left\{\theta_i^* + \frac{\lambda}{H_{ii}}, 0\right\} & \text{if } \theta_i^* < 0 \end{cases}$$

- Effect: **induces sparsity**

# Thanks Everyone!

Some of the slides in these lectures have been adapted/borrowed from materials developed by Mark Craven, David Page, Jude Shavlik, Tom Mitchell, Nina Balcan, Elad Hazan, Tom Dietterich, Pedro Domingos, Jerry Zhu, Yingyu Liang, Volodymyr Kuleshov, Sharon Li, Fred Sala
